

Building community healthcare supply chain resilience

FIReS Webinar 2

Prof. Ying Xie

Director of Centre of Intelligent Supply Chain

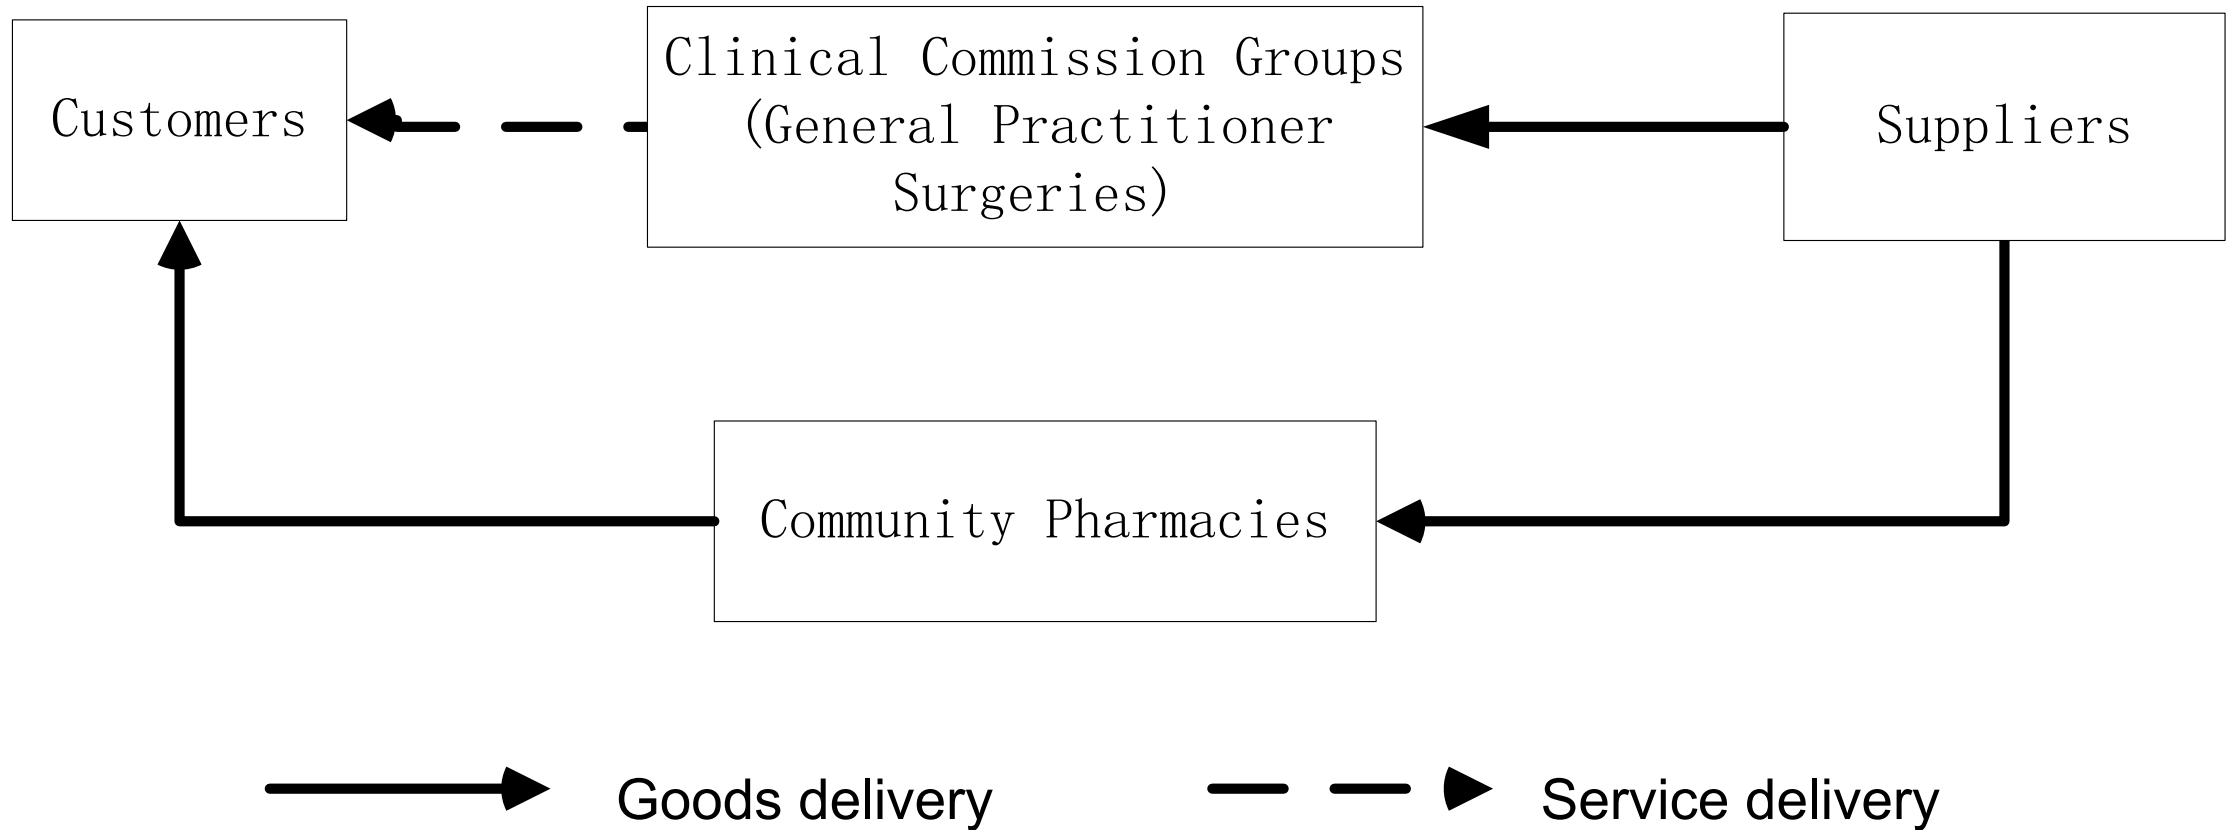

Faculty of Business and Law

Anglia Ruskin University

Agenda

1. Community healthcare (primary care) supply chain resilience
2. Natural Language Processing (NLP) of twitter data

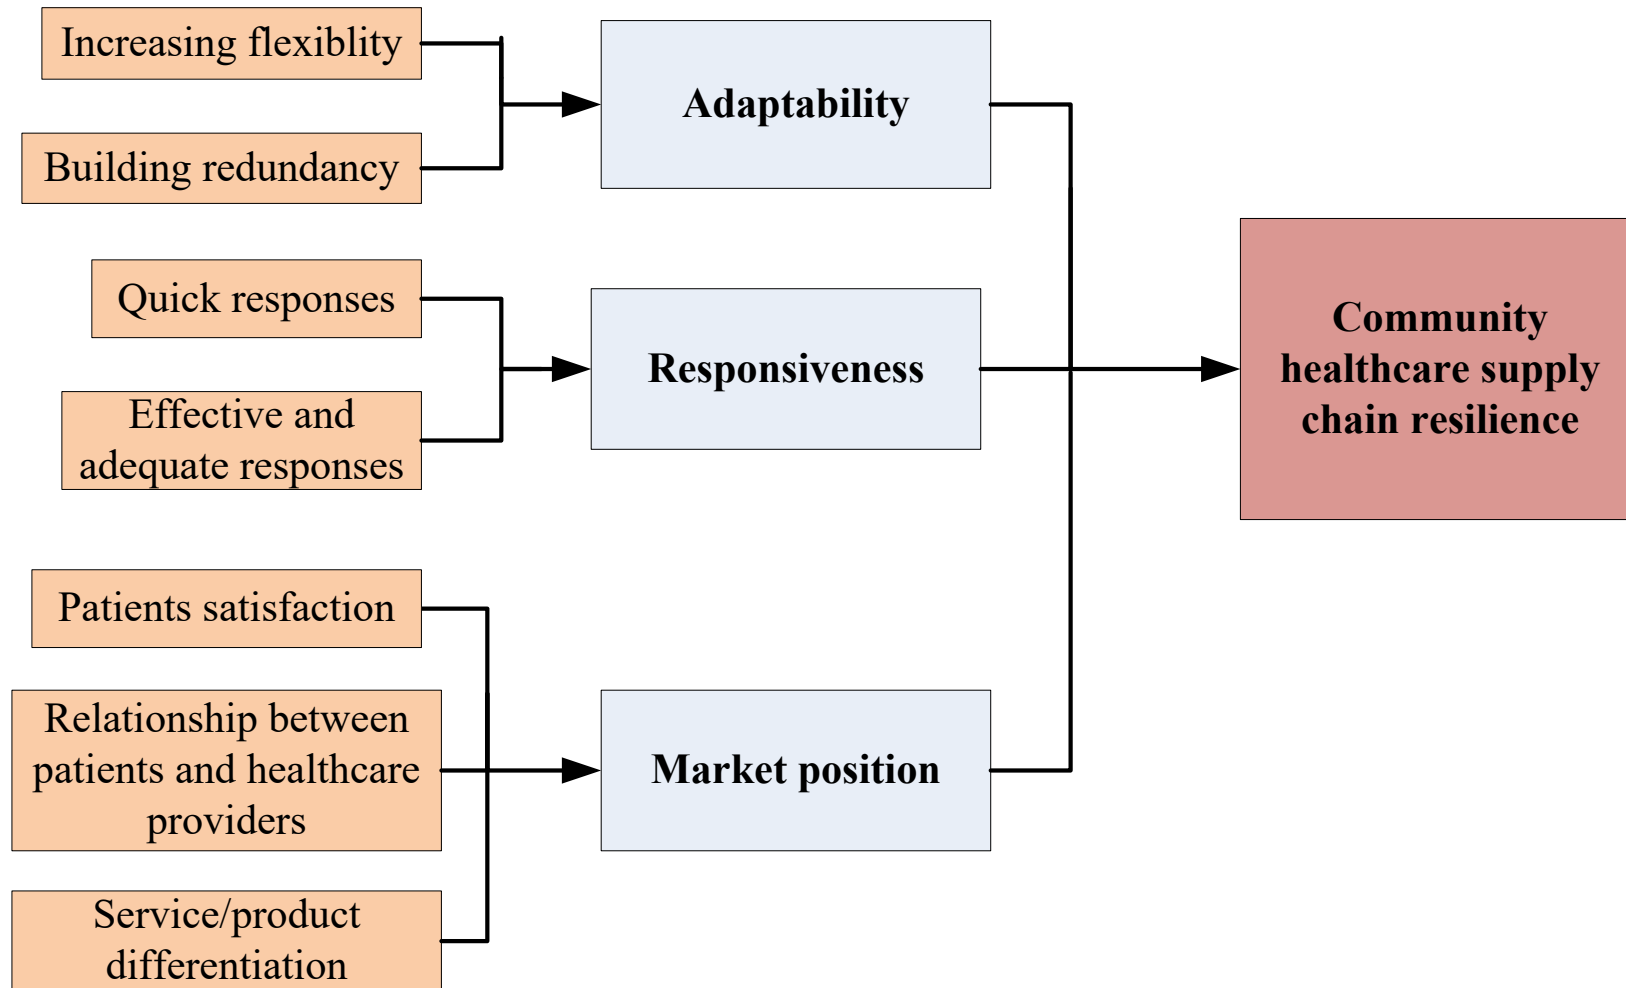

A healthcare supply chain

Research conducted

1. Focus group meetings with healthcare technology providers and Essex County Council, including Ocado technology, CGI, and Iotic
2. An electronic survey with the public from May to Jun 2020
3. Big data analysis of 420,000 tweets (text mining and natural language processing), from Clinical Commission Groups (CCGs), pharmacies, pharmaceutical suppliers/distributors

Community healthcare resilience

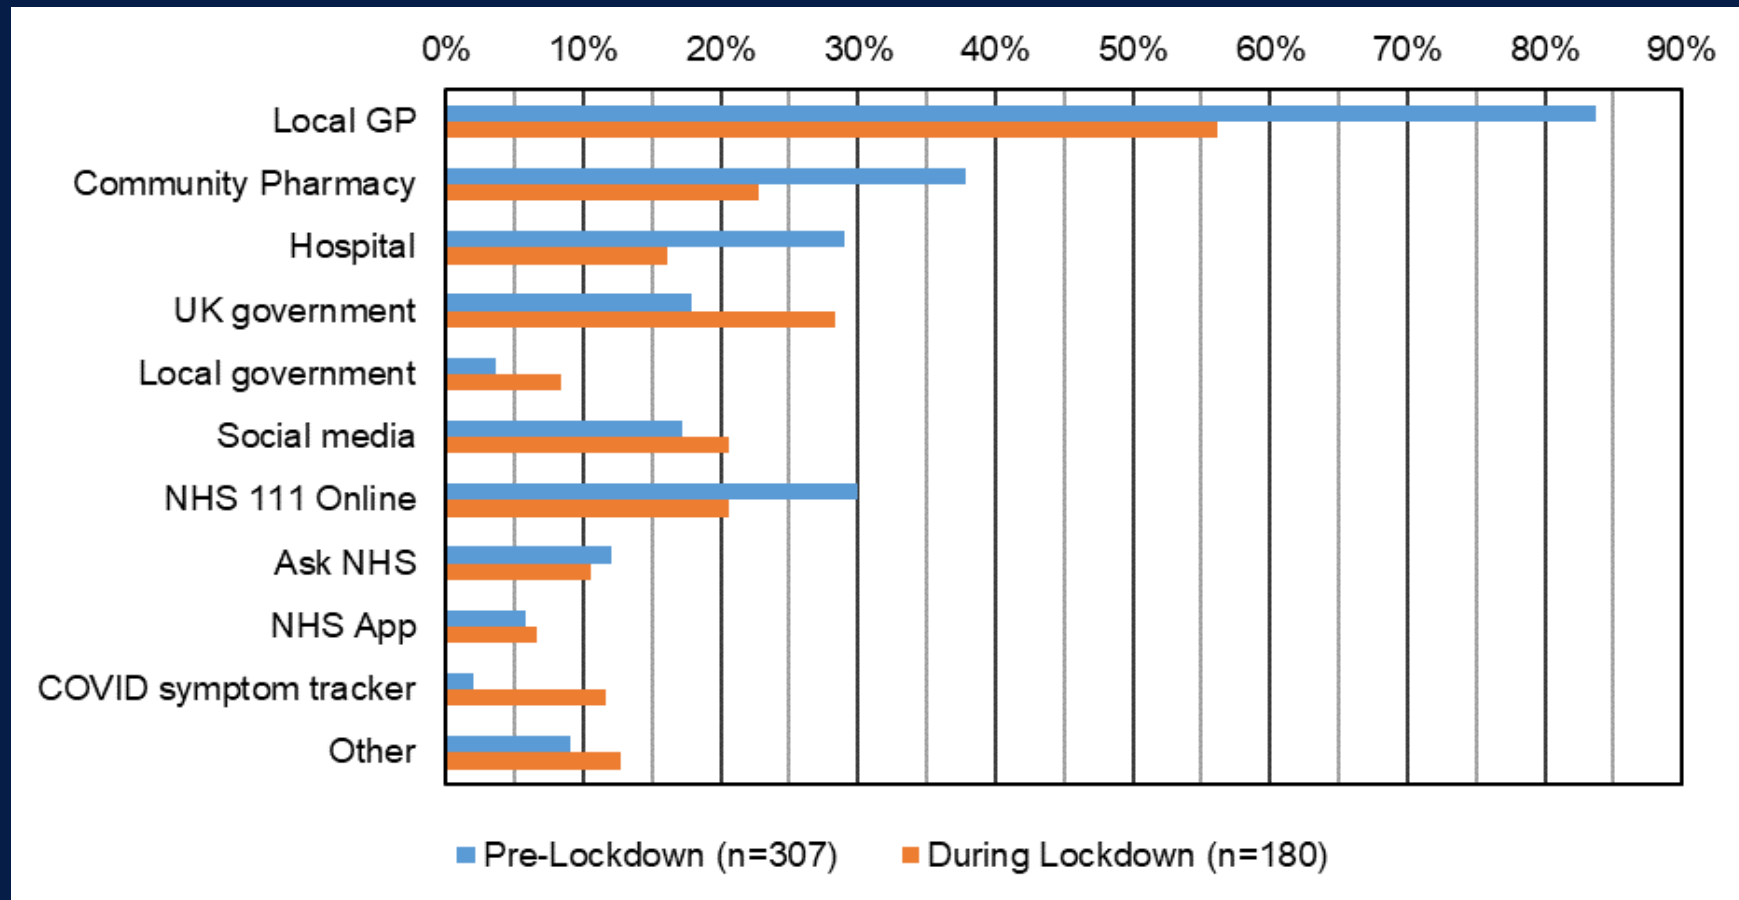

Key areas of community healthcare

1. Access to medical information before and during lockdown
2. Access to medical consultation/treatment before and during lockdown
3. Order and collection of prescription medicines before and lockdown

Findings from focus group meetings

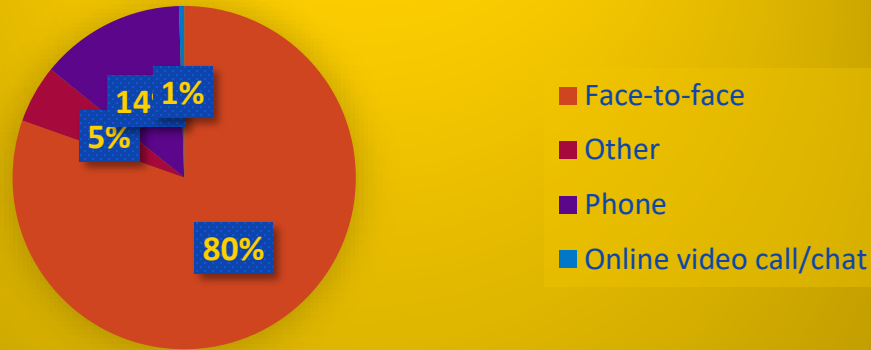

1. Future digital healthcare services will be intelligent developments of existing digital services
2. Making a transformative shift in community healthcare provision is led by patients' needs and structured around the citizen and community level;
3. Digital technologies create an efficient interface and enhance communication with patients;
4. Delivering a smart healthcare supply chain requires innovative interoperability of technologies, services and patients in an ecosystem, to inform and direct primary, secondary and home healthcare provision.

Sourced used to access medical information

Medical consultation appointments

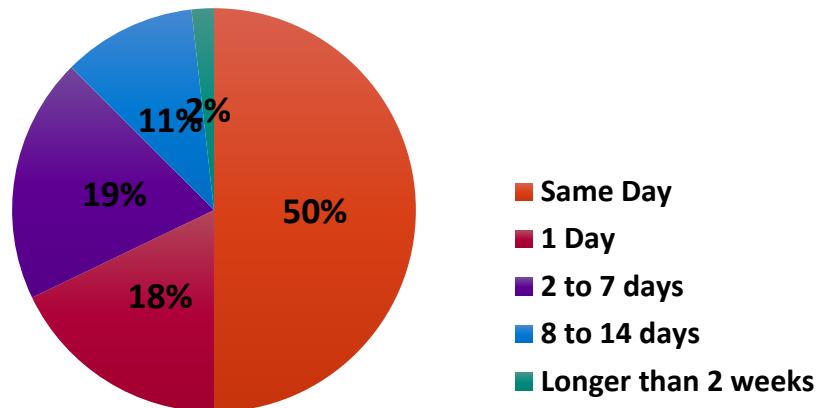

Appointment mode 2019

Appointment mode 2020

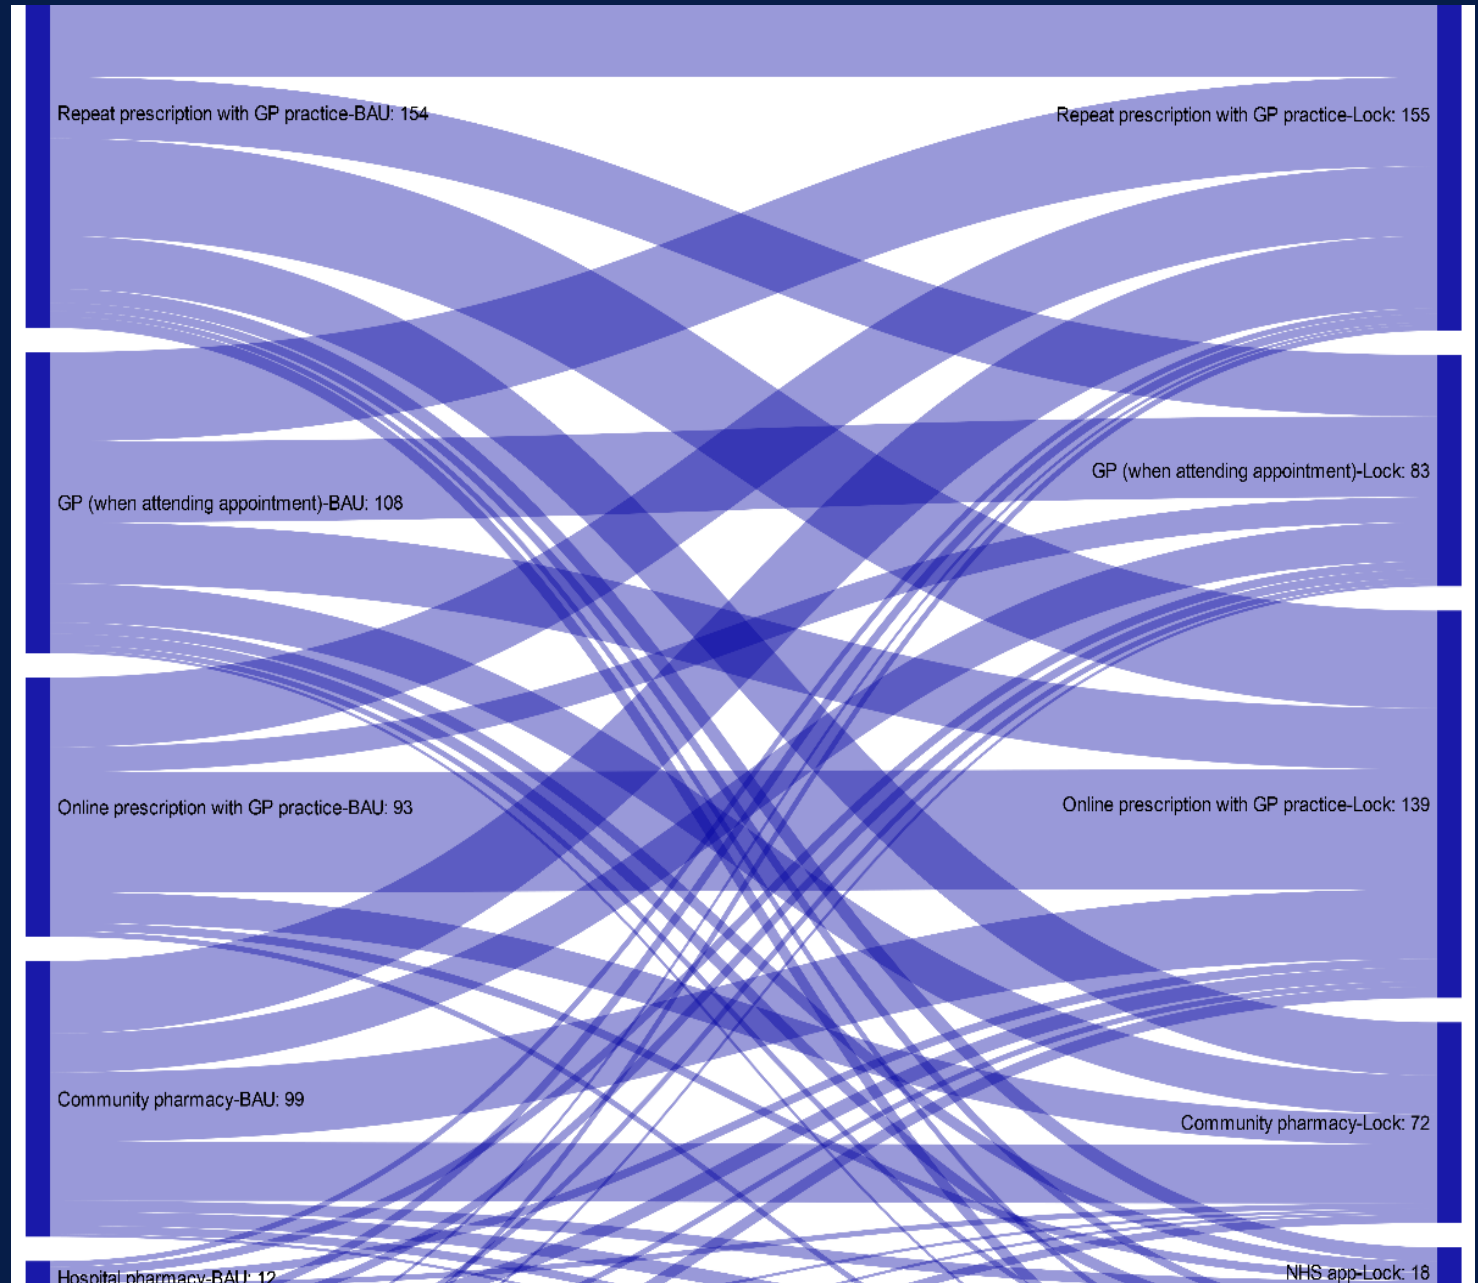

Waiting time 2019

Waiting time 2020

Ordering medicine before and after lockdown

The use and awareness of technologies by the public

1. During lockdown, among 307 responses, 39% were aware of the healthcare apps, and 61% were unaware of them.
2. During lockdown, among 117 responses, 24% used apps, and 76% did not use.

Community healthcare resilience

Resilience Dimensions	Sub-dimensions		Access to medical information	Access to medical consultation/treatment	Order and collection of prescription medicines
Adaptability	Increasing flexibility	Flexible production or supply volume	Y	Y	Y
		Flexible product/service portfolio	Y	Y	Y
		Flexible distribution	Y	Y	Y
		Introducing new products/services	Y	Y	Y
	Building redundancy	Excess capacity in production or transportation		N	Yes in distribution, but not in dispensing medicines or serving patients in pharmacies
		Multiple suppliers	Y	N	Yes in distribution, but not in dispensing medicines or serving patients in pharmacies
		Limited capacity utilisation	Not available	Y	Y
Responsiveness	Quick response		Y	Y	Y
	Effective and adequate response		N	Y	Y
Market position	Patients' satisfaction		N	Y	Y
	Relationship between patients and healthcare providers		Not available	Y	Y
	Service/product differentiation		Y	Y	Y

Natural Language Processing

- **Natural Language Processing (NLP)** is a branch of **Artificial Intelligence (AI)** that studies how **machines** understand human **language**. Its goal is to build systems that can make sense of text and perform tasks like translation, grammar checking, or topic classification

Sentiment analysis

- How it works:
- ML multi-classification task: positive, neutral, negative
- Words and emoji as predictive features: e.g., 😊 “in positive”, love “in positive”, and 😞 “in negative”, frustrated “in negative”

Topic classification

Eurosceptics welcome Tony Blair's political comeback and Brexit intervention

Telegraph.co.uk - 9 hours ago

Tony Blair's plan to make a comeback to political life by spearheading an anti-Brexit group was last night welcomed by Eurosceptics who said it would increase public support for leaving the EU.

'Brexit boost' will see best Black Friday bargains yet - with 60pc discounts on items

Telegraph.co.uk - 3 hours ago

Shoppers can look forward to "best ever" Black Friday deals this year thanks to Brexit, figures suggest, with discounts on goods expected to top 60pc on average.

Philip Hammond's 'relentless negativity' around Brexit attacked by ministers and MPs

Telegraph.co.uk - 11 hours ago

Philip Hammond has been attacked by ministers and MPs for his "relentless negativity" around Brexit after he said the UK was facing "unprecedented uncertainty" after voting to leave the European Union.

All Out War; The Brexit Club; The Bad Boys of Brexit review – rollicking referendum recollections

The Guardian - 2 hours ago

Britain is in the midst of an unfolding catastrophe that is poised to transform the country into an unemployed

Topic classification

- How it works:
- ML multi-classification task: politics vs technology vs sports
- Word distribution is predictive: each topic is formed by a combination of relevant words

Tweets posted by stakeholders in a healthcare supply chain

Twitter data from customers

- “A large-scale COVID-19 Twitter chatter dataset for open scientific research” published by Georgia State University’s Panacea Lab
- We used version 69.0 from Panacea Lab
- 1st March to 15th Aug 2020, tweets containing COVID related keywords and hashtags, including COVID, COVID19 (-19), coronavirus, pandemic, etc.
- Cleaned version with no retweets: 43,907,518 twitter IDs
- 15% of the Twitter IDs are hydrated using “Twarc” to extract original tweets and metadata from the IDs, such as time, date, user, user profile, etc.

Sentiment analysis of the tweets

- Rule-based methods perform the analysis based on a set of predefined rules, and the representative Python libraries are TextBlob and VADER
- Feature-based methods identify features from data and rely on machine learning techniques to train the analysis from these features. Logistic Regression, Naïve Bayes, Support Vector Machine Neural Network or ensembles
- Embedding-based methods leverage both machine learning and rule-based methods to detect semantics

Creating training set for sentiment analysis

- 100K training set by automatic labelling (noisy labelling method)
- 5K training set by manual human annotations (Amazon Mechanical Turk)
- Training data set from Sandford Sentiment 140 (1.6m tweets), or [Stanford Sentiment Treebank](#) (11,855 sentences)

LDA modelling

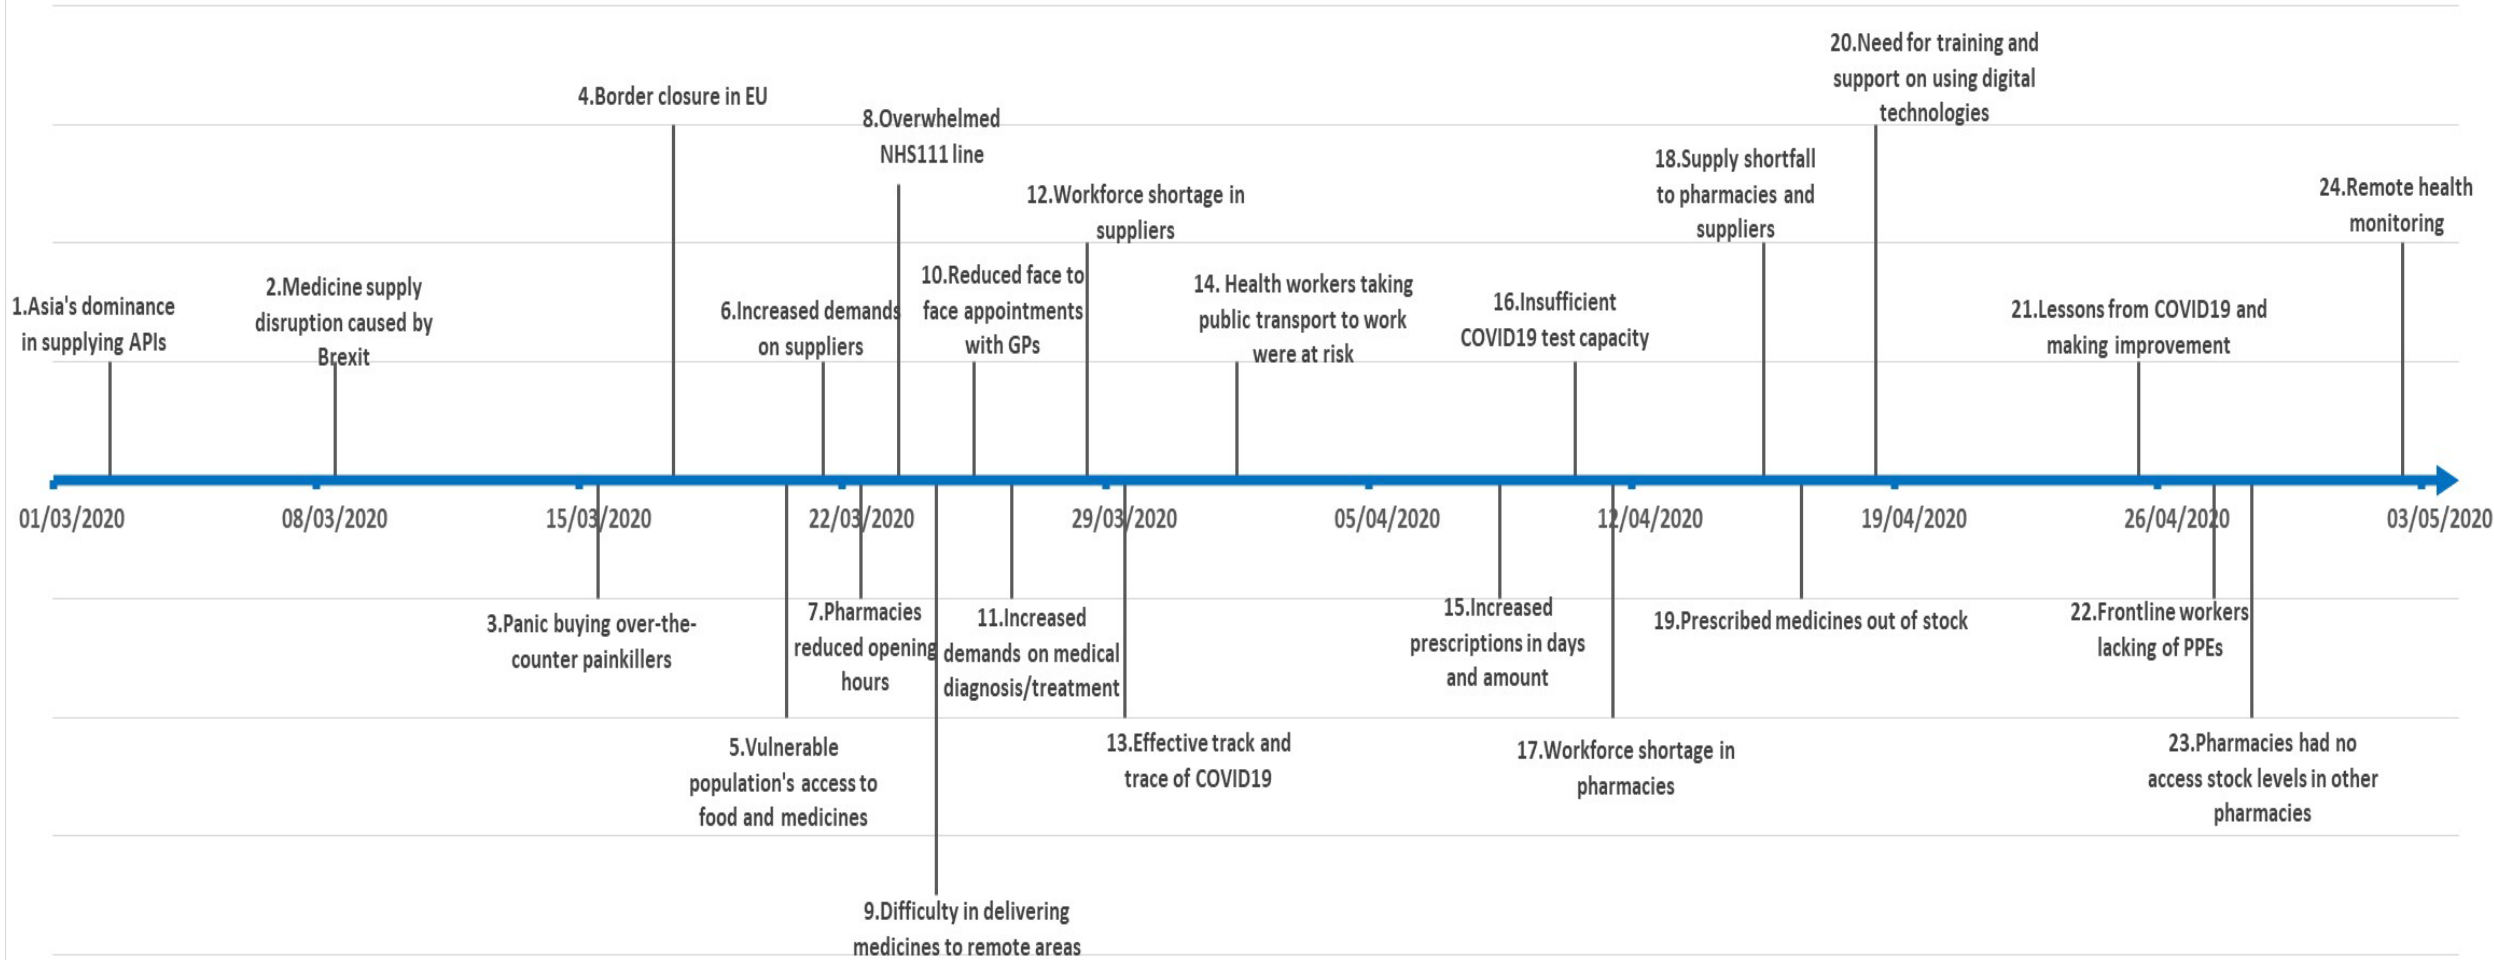

- Latent Dirichlet Allocation (LDA) is a generative probabilistic model developed for collections of discrete data called text corpora (Blei et al. 2003).
- We are interested in learning the various distributions, the set of N topics \mathbf{Z} , their association with word probabilities $\boldsymbol{\varphi}$, the topic of each word \mathbf{W} , and the particular topic mixture of each document $\boldsymbol{\theta}$. Given the parameters α and β , the joint probability of a document can be written as:

$$P(\mathbf{W}, \mathbf{Z}, \boldsymbol{\theta}, \boldsymbol{\varphi} ; \alpha, \beta) = \prod_{i=1}^K P(\varphi_i; \beta) \prod_{j=1}^M P(\theta_j; \alpha) \prod_{t=1}^N P(Z_{j,t} | \theta_j) P(W_{j,t} | \varphi_i)$$

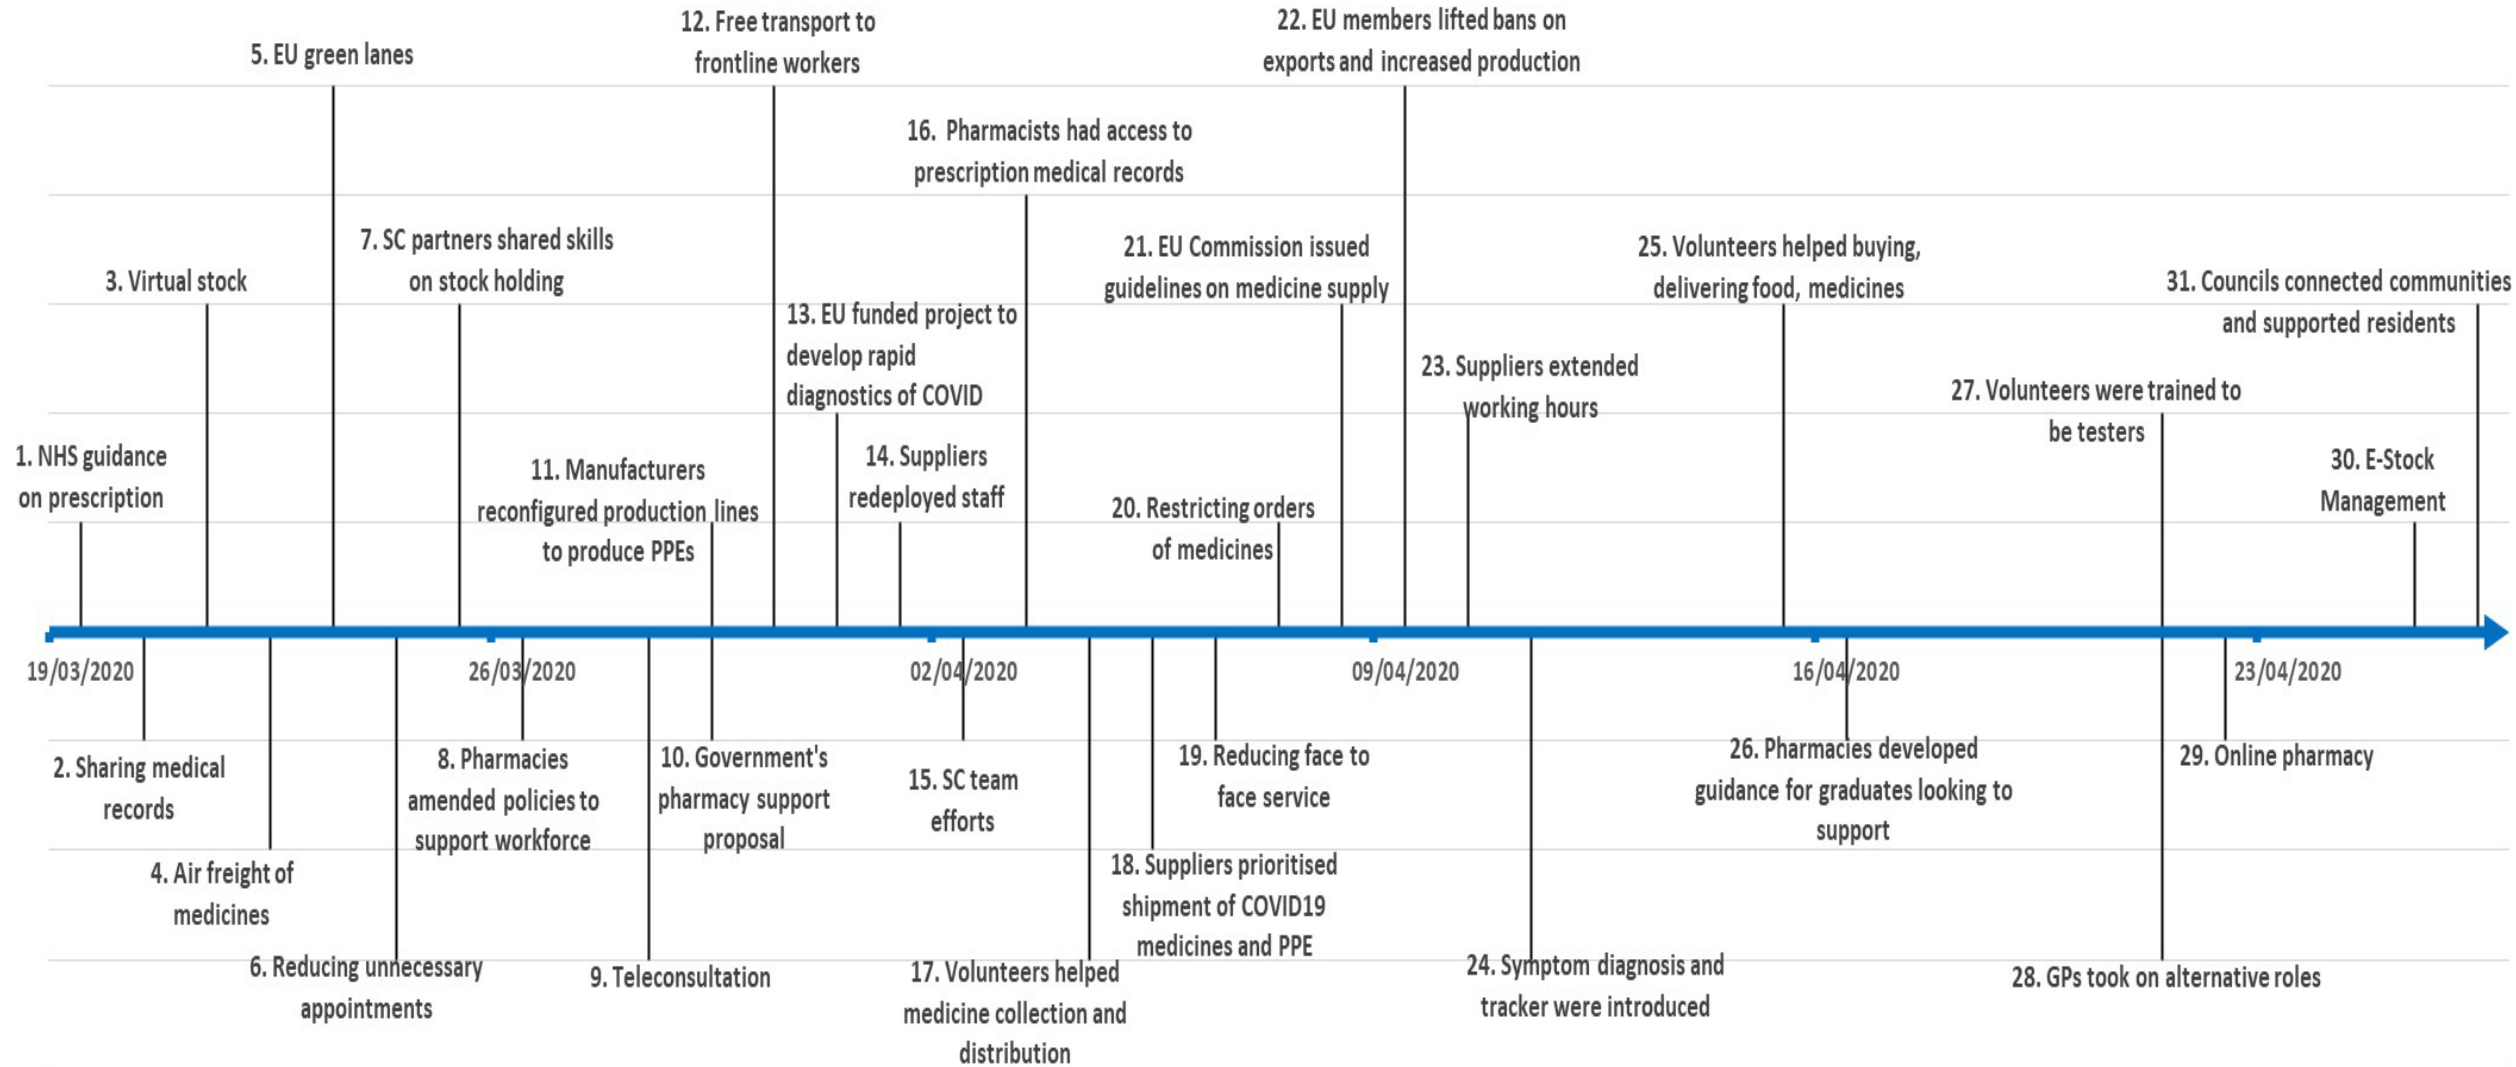

Topics identified for Pharmacies Negative tweets

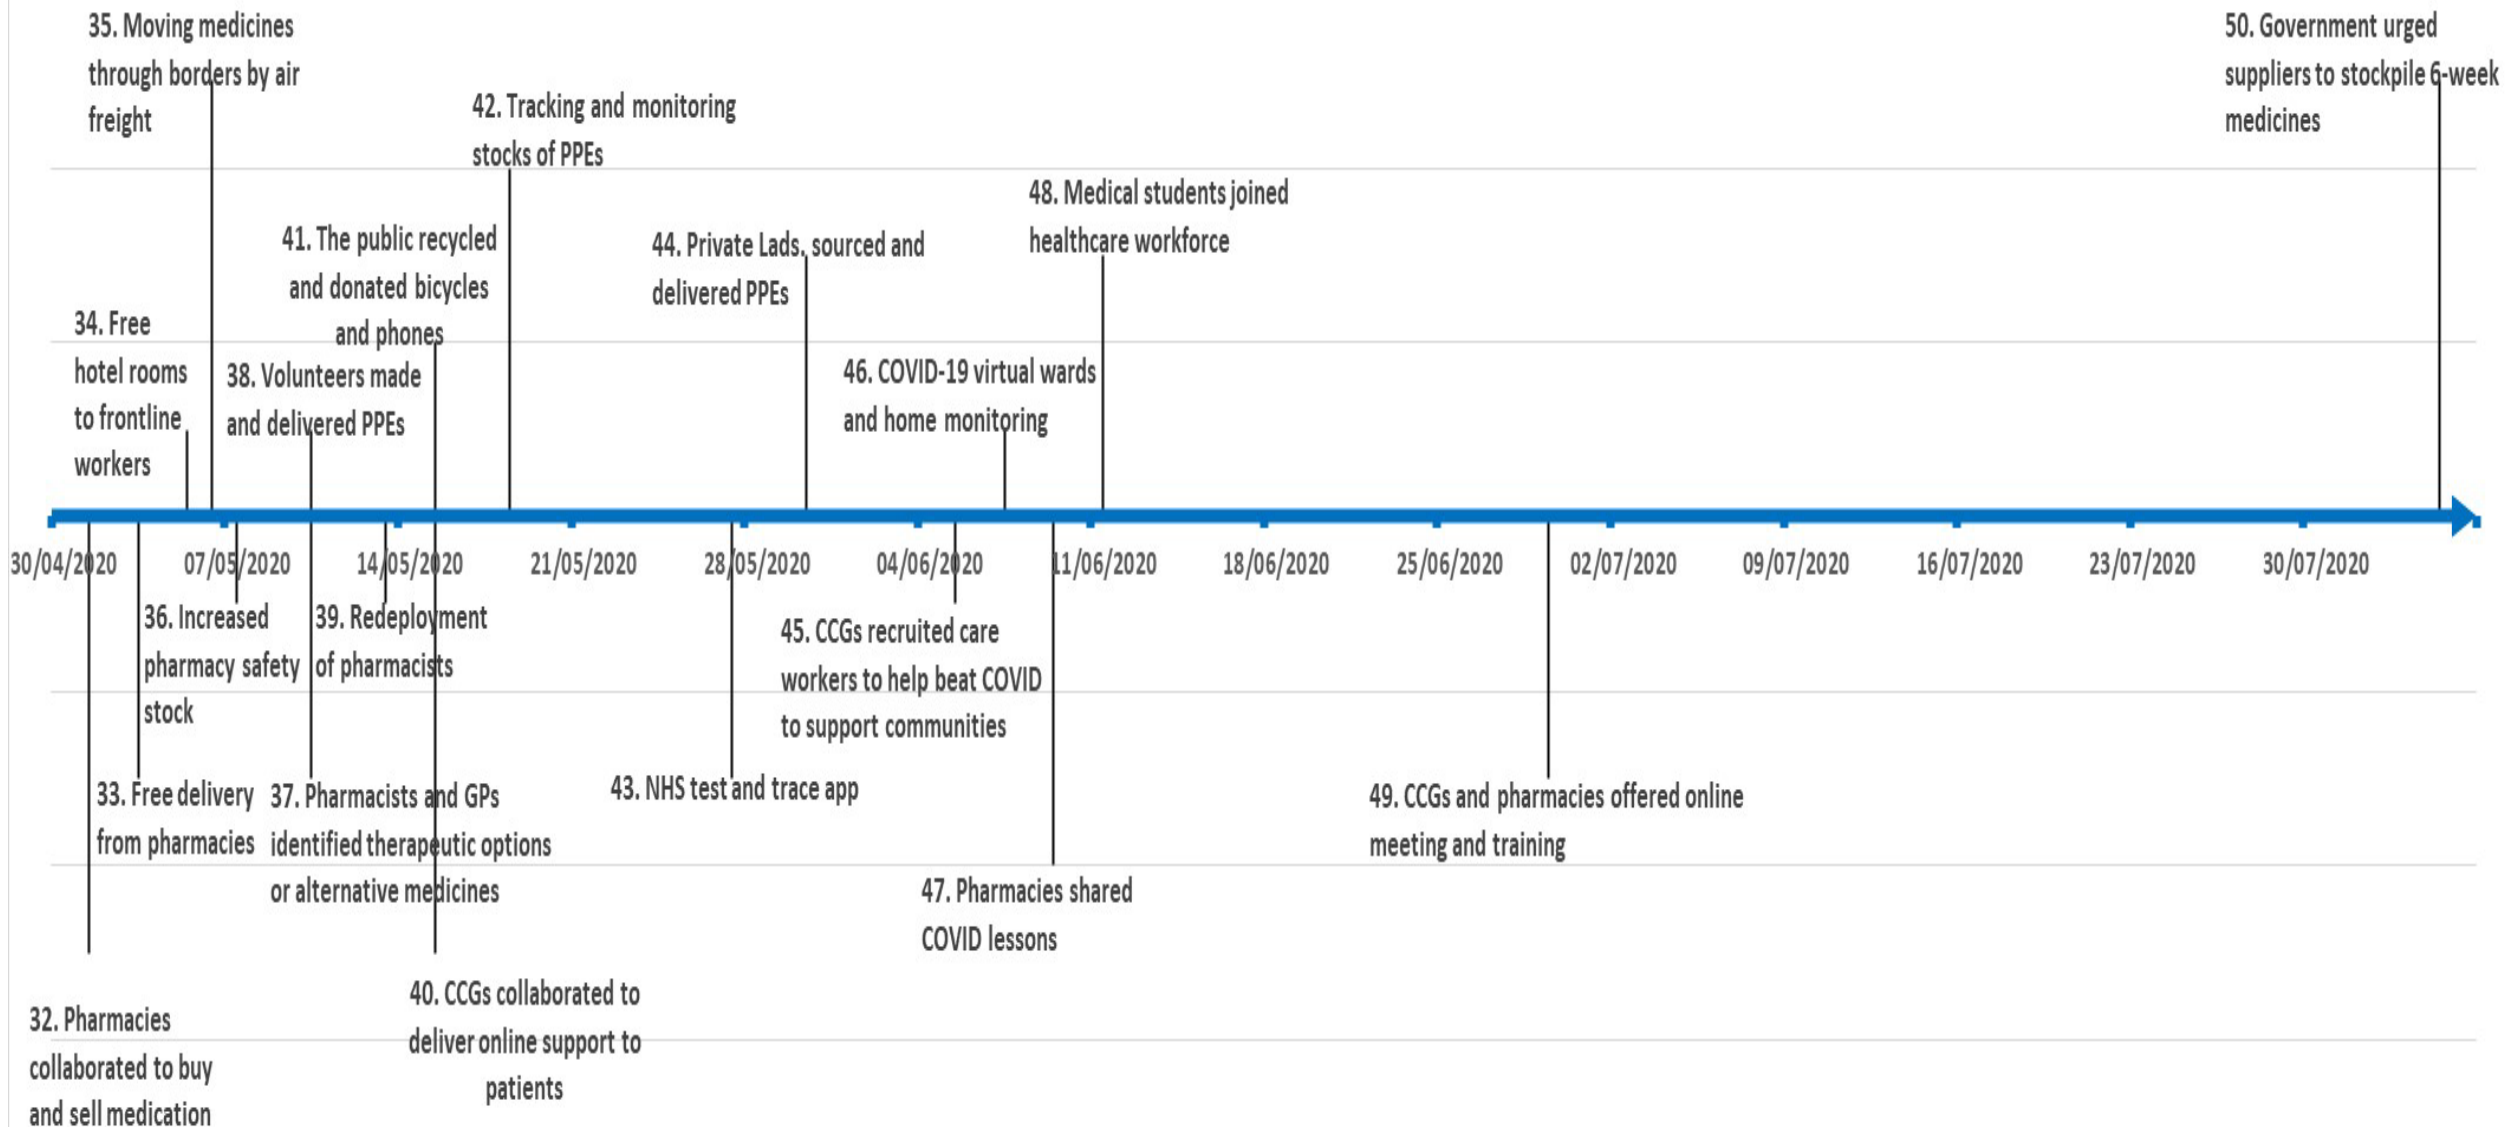

Timeline of risks identified in 01/03-03/05/2020

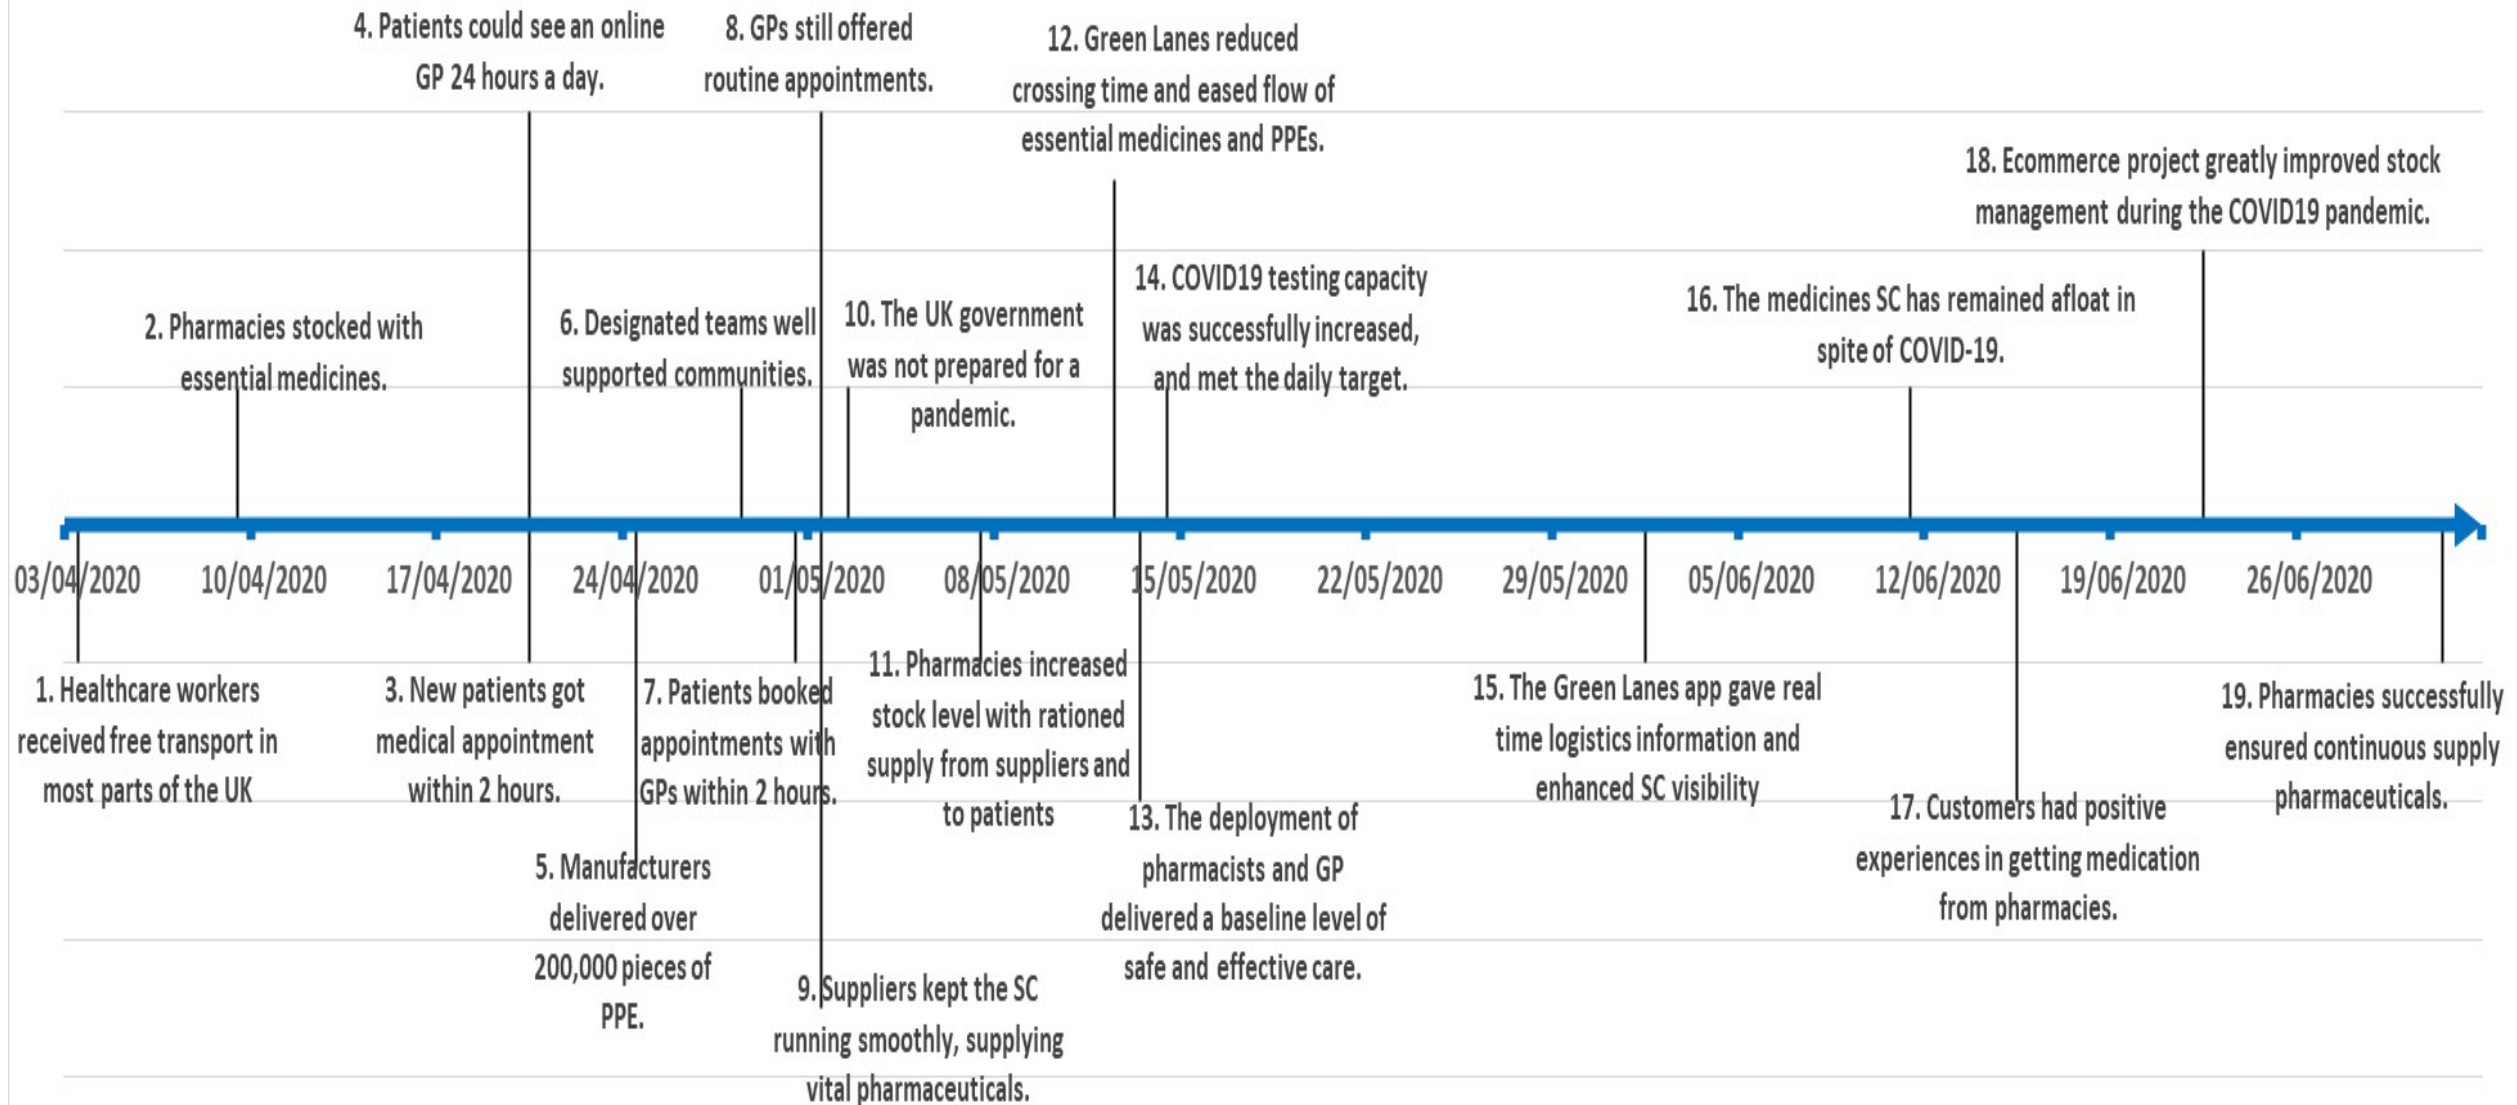

Timeline of mitigation actions 19/03-30/04/2020

Timeline of mitigation actions 01/05-04/08/2020

Timeline of mitigation impacts 03/04-01/07/2020

Twitter data

- An alternative source to collect risk data
- Real time twitter data analysis enables stakeholders to identify risks at early stage and make quick responses
- Risks and risk mitigations can be included in a central depository

Thank you and
Any question?
